Allara Health Dashboard Redesign

Redesigning the dashboard for clear navigation

		Simone Dunbar	– Design Partner		

Overview

Our team collaborated to redesign the dashboard for Allara Health, a virtual care platform specializing in women's hormonal and metabolic health, particularly, conditions like polycystic ovary syndrome (PCOS)

Current Dashboard Features

To begin, the project manager Liv Jenks provided our team with a video detailing the current major features of the dashboard

Static Care Timeline
Informational block for expectation setting (disappears after four appointments, collapsable)

To-Dos
Collect information from patients: Share home address, lab preferences, join appointments, download mobile app, review nutrition materials

Appointments
Modify appointments, add details to calendar, access provider notes post-appointment

Booking Appointments
Medical follow-up, nutrition follow-up, confirm state, see availability, book with dietician.

My Health
View past appointments, book follow-up visits, see lab orders/results, download PDFs, track progress (e.g., walking 10,000 steps, drinking two liters of water)

Major Pain Points

Liv Jenks also provided our team with a list of current pain points.

Chaotic nature and oversaturation of information on the dashboard

Users being unsure on where to proceed and how to join appointments

**Patients having difficulty accessing post-visit notes**

Redesign Opportunities

Through discussion, our team decided to go in the direction of splitting up the oversaturation of information on the dashboard into distinct pages, with the dashboard serving more as a navigational page.
Sketches

To begin, our team made initial sketches of potential designs.
See my sketches below

Dashboard   Appointments   To-Dos

Wireframe

From here, we identified the features from the sketches we wanted to proceed with, and integrated them into a wireframe, made in Balsamiq. Primarily, these features were clear sectioning of information in the dashboard, gameifcation of the To-Dos through a progress bar, and an appointments page that allowed you to expand each appointment to see more information.
For this step, I created the To-Dos page.

Feedback

We sent these Wireframes to Liv Jenks for feedback, from which we indentified the most important notes, listed below.

Positives to keep
Modular design for clarity
Gameifcation of To-Dos

Requested changes
Reduce the prominence of infrequent lab results

Final Prototype

To finalize this project, we created a fully responsive prototype in Figma. For this final step, I created the To-Do pages.

0:03 / 0:35

See the figma file below.

Coded prototype
